Week 1

Integers and Absolute Value

Compare. Use $>$, $<$, or $=$ to complete each statement.

a. $-4 \square -2$

Graph -4 and -2 on the number line.

A number on the left is less than a number on the right.

Thus, -4 is less than -2 .

$-4 < -2$

b. $|-4| \square |-2|$

The *absolute value* of a number is its distance from zero on the number line.

Thus $|-4| = 4$ and $|-2| = 2$.

Since $4 > 2$, $|-4| > |-2|$

Compare. Use $>$, $<$, or $=$ to complete each statement.

1. $-3 \square -2$

2. $-5 \square 1$

3. $0 \square -2$

4. $1 \square 0$

5. $1 \square -1$

6. $-5 \square -3$

7. $|-3| \square 0$

9. $|-3| \square 2$

10. $|-6| \square 6$

11. $|3| \square |-2|$

12. $|-7| \square 0$

Week 2

The Distributive Property

According to the Distributive Property, you distribute or "pass out" a multiplication to each part of a sum or difference in parentheses.

In $2(a + b) = 2a + 2b$, we "pass out" the 2 by multiplying it by both the a and the b .

Multiply $6(x - 9)$.

$$\begin{aligned} 6(x - 9) &= 6x - 6(9) \\ &= 6x - 54 \end{aligned}$$

Multiply $(4 - h)(-3)$.

$$\begin{aligned} (4 - h)(-3) &= 4(-3) - h(-3) \\ &= -12 - (-3h) \\ &= -12 + 3h \\ &= 3h - 12 \end{aligned}$$

Complete with the appropriate number or variable.

1. $12(5 + 9) = 12 \cdot 5 + \underline{\hspace{2cm}} \cdot 9$
2. $(3 - 8)7 = \underline{\hspace{2cm}} \cdot 7 - 8 \cdot \underline{\hspace{2cm}}$
3. $z(a - b - c) = \underline{\hspace{2cm}} \cdot a - z \cdot \underline{\hspace{2cm}} - \underline{\hspace{2cm}} \cdot \underline{\hspace{2cm}}$
4. $[14 + (-3)]7 = 14 \cdot \underline{\hspace{2cm}} + \underline{\hspace{2cm}} \cdot 7$
5. $p[(-3) + n] = p \cdot \underline{\hspace{2cm}} + \underline{\hspace{2cm}} \cdot \underline{\hspace{2cm}}$

Multiply each expression.

6. $4(x + 5) = \underline{\hspace{4cm}}$
7. $(6 - m)(-4) = \underline{\hspace{4cm}}$
8. $s(-6 + t) = \underline{\hspace{4cm}}$
9. $8(j - 2k + l) = \underline{\hspace{4cm}}$
10. $(z - 4)(-5) = \underline{\hspace{4cm}}$
11. $9[(-7) - y] = \underline{\hspace{4cm}}$

Week 2

Simplifying Variable Expressions

Simplify $5n + (-n - 4)(-2)$.

$$5n + (-n - 4)(-2)$$

$$= 5n + (-n)(-2) - 4(-2)$$

$$= 5n + 2n + 8$$

$$= (5 + 2)n + 8$$

$$= 7n + 8$$

Use the Distributive Property.

Multiply. Think of $-4(-2)$ as $+(-4)(-2)$.

Use the Distributive Property to combine like terms.

$$= 5k - 8 \underline{\hspace{2cm}} - 4$$

$$= (5 - 8) \underline{\hspace{2cm}} - 4$$

Simplify each expression.

Week 5

Exponents and Multiplication

Simplify $m^3 \cdot m^4$ and $(n^2)^3$.

The base of m^3 is m and the base of m^4 is m . So, they have the same base. To multiply variables with the same base, add the exponents.

$$m^3 \cdot m^4 = m^{3+4} = m^7$$

This rule works because you are combining 3 factors of m and 4 factors of m .

$$m^3 \cdot m^4 = (m \cdot m \cdot m) \cdot (m \cdot m \cdot m \cdot m) = m^7$$

Simplifying $(n^2)^3$ involves raising a power (n^2) to a power. To find a power of a power, multiply the exponents.

$$(n^2)^3 = n^{2 \cdot 3} = n^6$$

This rule works because you are using n^2 as a factor 3 times.

$$(n^2)^3 = n^2 \cdot n^2 \cdot n^2 = (n \cdot n) \cdot (n \cdot n) \cdot (n \cdot n) = n^6$$

Simplify each expression. Show an intermediate step.

Week 7

Probability

Suppose you select a letter at random from the words MIDDLE SCHOOL. Find $P(L)$ and $P(\text{not } L)$.

First determine the number of possible outcomes. There are 12 letters in the two words, so there are 12 possible outcomes when you select a letter at random. Next determine the number of favorable outcomes for $P(L)$. There are two L's.

$$\text{Thus, } P(L) = \frac{\text{number of favorable outcomes}}{\text{number of possible outcomes}} = \frac{2}{12} = \frac{1}{6}$$

You can find $P(\text{not } L)$ several ways. Since there are 12 possible outcomes and 2 are L, $12 - 2 = 10$ are not L.

$$\text{Thus, } P(\text{not } L) = \frac{\text{number of favorable outcomes}}{\text{number of possible outcomes}} = \frac{10}{12} = \frac{5}{6}$$

$$\text{Also } P(\text{not } L) = 1 - P(L)$$

$$= 1 - \frac{1}{6} = \frac{5}{6}$$

$$25x - 40 = 160$$

$$25x - 40 + 40 = 160 + 40$$

Week 9

Simple and Compound Interest

Find the balance in an account when \$500 is deposited at 4% interest compounded semi-annually for 2 years.

The table shows the interest and balance for each half year.

Principal at Beginning of Period	Interest	Balance
$\frac{1}{2}$ year: \$500		
1 year:		
$1\frac{1}{2}$ year:		
2 year:		

The balance after 2 years is \$541.21.

You can also find the balance with the formula $B = p(1 + r)^n$, where B is the ending balance. The principal p is 500. The rate is for a half year; 4% annual interest equals 2% per half year. Thus r is 0.02. The number of compounding periods n is 4, because there are 4 half years in 2 years.

$$B = p(1 + r)^n$$

$$B = 500(1 + 0.02)^4 \text{ Substitute.}$$

$$B = \$541.22 \quad \text{Use a calculator. Round to the nearest cent.}$$

With the formula, the ending balance is \$541.22. The difference is due to rounding error.

Find the ending balance when \$1,500 is deposited at 6% interest compounded semi-annually for 2 years.

1. Use a table.

Principal at Beginning of Period	Interest	Balance
$\frac{1}{2}$ year: \$1,500		
1 year:		
$1\frac{1}{2}$ year:		
2 year:		

2. Use the formula:

$$B = p(1 + r)^n = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$$

Week 10

Fractions, Decimals, and Percents

Write $\frac{7}{8}$ as a percent and 64% as a fraction in lowest terms.

Divide $7 \div 8$.

$$\begin{array}{r} 0.875 \\ 8 \overline{)7.000} \\ \underline{64} \\ 60 \\ \underline{56} \\ 40 \\ \underline{40} \\ 0 \end{array}$$

$$\frac{7}{8} = 0.875$$

$$0.875 = 87.5\%$$

$$\text{Thus } \frac{7}{8} = 87.5\%.$$

64% means 64 parts per 100.

$$64\% = \frac{64}{100}$$

$$= \frac{2^4}{2^2 \cdot 5^2}$$

$$= \frac{16}{25}$$

$$\text{Thus } 64\% = \frac{16}{25}.$$
